If you represent a hosting company and would like your sites added to the list of sites monitored each day please [mail us](#).

Interpreting the Table

The table is based on observing movements in sites queried by people using our [what's that site running?](#) form. Consequently, "New" sites are those which are being queried for the first time by users of this site, and are not necessarily new to the Internet. "Lost" sites are those which have moved to a competitor, and "Gains" are those sites which have been taken from a competitor.

We also provide a more comprehensive analysis of switching between hosting locations based on the sites found by the web server survey (55M in October 2004), which is described in more detail [here](#).

Sites shown as hosted on netblocks assigned to the internet registries such as ARIN & RIPE, are hosted on ip addresses which have been recently assigned and for which we do not yet have delegation information.

"unspecified LACNIC allocation" is the ip address registry for Latin America. So far as we know LACNIC does not make ip address delegation information available, and so the ip address space controlled by that registry shows up in this table as if it was a single hosting location. If you are able to help us obtain ip address delegation information for LACNIC, please [mail us](#).

Sites that use caching or content delivery systems sometimes appear to fluctuate between their primary location, and their content delivery system, typically Akamai or Speedera.

Your comments and suggestions are most welcome webmaster@netcraft.com
